## **GLOSSARY OF ACRONYMS AND DEFINED TERMS**

<b>Acronym/Defined Term</b>	<b>Meaning</b>
AFUDC	Allowance for Funds Used During Construction
Commission	New Mexico Public Regulation Commission
CCN	Certificate of Public Convenience and Necessity
HPILS	High Priority Incremental Load Study
ITP	Integrated Transmission Planning
ITPNT	ITP Near-Term
kV	kilovolt
NTC	Notification to Construct
PSCo	Public Service Company of Colorado, a Colorado corporation
Proposed Project	345 kV transmission line and associated substation facilities in Eddy and Lea Counties, New Mexico
ROW	right-of-way
SPP	Southwest Power Pool
SPS	Southwestern Public Service Company, a New Mexico corporation
UE	Utility Engineering
Xcel Energy	Xcel Energy Inc.

## LIST OF ATTACHMENTS

<b>Attachment</b>	<b>Description</b>
RCA-1	SPS Vicinity Map of Southeast New Mexico Service Area Facilities
RCA-2	Potash Junction-Roadrunner 345 kV Transmission Line Project One-Line Diagram
RCA-3	SPP Delivery Point Network Study, DPA-2011-June-073
RCA-4	SPP Notification to Construct Letter, SPP-NTC-200257
RCA-5	SPS Intercontinental Potash SIS Load Interconnection Study Report No. 110801

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1           **I. WITNESS IDENTIFICATION AND QUALIFICATIONS**

2   **Q. Please state your name and business address.**

3   A. My name is Roland C. Azcarraga, and my business address is 600 S. Tyler  
4   Street, Amarillo, Texas 79101.

5   **Q. On whose behalf are you testifying?**

6   A. I am filing testimony on behalf of Southwestern Public Service Company, a  
7   New Mexico corporation ("SPS") and wholly-owned subsidiary of Xcel  
8   Energy Inc. ("Xcel Energy"). Xcel Energy is a registered holding company  
9   that owns several electric and natural gas utility operating companies and a  
10  regulated natural gas pipeline company.<sup>1</sup>

11 **Q. By whom are you employed and in what position?**

12 A. I am employed by SPS as a Senior Engineer Transmission Planning.

13 **Q. Please briefly outline your responsibilities as Senior Engineer**  
14 **Transmission Planning.**

15 A. My duties include performing planning studies for new transmission  
16 facilities required for generation, customer additions, and studies for

---

<sup>1</sup> Xcel Energy is the parent company of four wholly-owned electric utility operating companies: Northern States Power Company, a Minnesota corporation; Northern States Power Company, a Wisconsin corporation; Public Service Company of Colorado, a Colorado corporation ("PSCo"); and SPS. Xcel Energy's gas pipeline subsidiary is WestGas InterState, Inc.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 compliance work associated with the North American Electric Reliability  
2 Corporation transmission reliability standards. I am responsible for  
3 submitting budget items for improvements to the transmission system that  
4 are needed to integrate the requests as outlined in the results of the studies. I  
5 am also responsible for providing fault studies, short circuit reduction  
6 models, one-line model diagrams to our department and consultants for on-  
7 going power flow, dynamics, electromagnetic transient programs, and  
8 harmonics studies.

9 **Q. Describe your educational background.**

10 A. I received my Bachelor of Science in Electrical Engineering degree in 1980  
11 from Mapua Institute of Technology in Manila, Philippines.

12 **Q. Please describe your professional experience.**

13 A. In 1980, I worked as an entry-level engineer for an electrical contracting  
14 company (P.G. Tomas Inc.). In 1982, I worked as a field engineer for an oil  
15 refining and marketing company (Caltex, Phil). In 1983, I moved to the  
16 United States and worked for an electrical contractor (B&G Electric Co.) in  
17 Pampa, Texas. I joined American Smelting and Refining Company in 1990  
18 as an engineer for the copper refinery plant in Amarillo. I joined Utility  
19 Engineering ("UE") in 1996 and was assigned to SPS substation design, and

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 then in 2000 I was assigned to UE power plant design. I transferred to SPS  
2 Electrical Operations Transmission Engineering as a commissioning  
3 engineer in 2001. In 2006, I assumed my current position as a Senior  
4 Planning Engineer for the SPS Transmission Planning Department.

5 **Q. Do you hold any professional licenses?**

6 A. Yes. I am a registered Professional Engineer in the State of Texas.

7 **Q. Are you a member of any professional organizations?**

8 A. Yes. I am a senior member of the Institute of Electrical and Electronic  
9 Engineers.

10 **Q. Have you testified before any regulatory authorities?**

11 A. Yes. I have filed testimony with the Public Utility Commission of Texas.

12

1                   **II. ASSIGNMENT AND OVERVIEW OF THE FILING**

2   **Q.    What is the purpose of your testimony?**

3    A.    My testimony supports SPS's application for New Mexico Public Regulation  
4           Commission ("Commission") approval of a certificate of public convenience  
5           and necessity ("CCN") for the proposed construction and operation of a 345  
6           kilovolt ("kV") transmission line, and the associated facilities in Eddy and  
7           Lea Counties, New Mexico ("Proposed Project"), as well as the related  
8           location approval of the 345 kV transmission line from the Potash Junction  
9           Substation to the proposed Roadrunner Substation. I will also explain why  
10          the transmission line and Roadrunner Substation will be built to 345 kV  
11          specifications, but will initially be operated at 230 kV.

12                 My testimony provides an overview of SPS's transmission system  
13                 and operations in the service area, explain SPS's need for the Proposed  
14                 Project, describes the proposed 345 kV transmission line and Roadrunner  
15                 Substation, and discusses how SPS's filing satisfies the requirements for  
16                 issuance of a CCN for the Proposed Project and for location approval of the  
17                 proposed 345 kV transmission line. Finally, I will provide the cost estimate  
18                 for the Proposed Project, including SPS's request for an allowance for used  
19                 during construction ("AFUDC").

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 **Q. Please identify the other SPS witnesses who provide testimony in**  
2 **support of SPS's Application, and generally describe the subjects they**  
3 **will address.**

4 **A.** In addition to my pre-filed testimony, the following witnesses are filing  
5 testimony in support of SPS's Application: (1) Jason Brunner's testimony  
6 discusses SPS's request for Commission determination of the right-of-way  
7 ("ROW") width for the proposed 345 kV transmission line, and also the  
8 circuit design and type of construction required for the Proposed Project; (2)  
9 Scott Morris' testimony discusses the route selection and SPS's location  
10 approval request for the proposed 345 kV transmission line, and provides the  
11 schematic diagram showing the proposed transmission line and its  
12 interconnection to the grid; and (3) Howard C. Higgins' testimony evaluates  
13 the potential environmental, biological, and cultural resource impacts of the  
14 Proposed Project, and also supports SPS's request for location approval of  
15 the 345 kV transmission line. Further, Mr. Higgins' testimony discusses the  
16 permits required from the United States Bureau of Land Management  
17 ("BLM") and the New Mexico State Lands Office ("NMSLO").

18 **Q. Briefly describe the facilities that are associated with the Proposed**  
19 **Project.**

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 A. SPS proposes to locate, construct, and operate the Proposed Project, which  
2 will connect the existing Potash Junction Substation to the proposed  
3 Roadrunner Substation in order to serve existing and new retail load  
4 customers and provide increased reliability for SPS's southeastern New  
5 Mexico transmission system. Because a new retail load customer recently  
6 requested to connect approximately 80 megawatts ("MW") of new load onto  
7 SPS's existing 115 kV transmission network, the Proposed Project is needed  
8 to mitigate the voltage and thermal violations during system intact and single  
9 contingency conditions in Eddy and Lea Counties, New Mexico (referred to  
10 as SPS's southeastern New Mexico service area) due to the impact of the  
11 new load.

12 **Q. Please describe SPS's southeastern New Mexico transmission system.**

13 A. SPS's existing transmission system in Eddy and Lea Counties, New Mexico,  
14 consists of 36 miles of 345 kV transmission line, 113 miles of 230 kV  
15 transmission line, 314 miles of 115 kV transmission line, and 128 miles of  
16 69 kV transmission line. The southeastern New Mexico service area is fed  
17 from SPS's gas fired Cunningham Plant and the gas fired Lea Power  
18 Partners-Hobbs Plant at 230 kV level, and from SPS's gas fired Maddox  
19 Plant at 115 kV level. The total nameplate generating capacity of the

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 Cunningham and Maddox Plants is approximately 650 MW, while the  
2 Hobbs Plant is approximately 532 MW.

3 The Cunningham Plant and Hobbs Plant are interconnected by two  
4 115 kV transmission lines and a 230 kV transmission line, while  
5 Cunningham and Maddox Plants are interconnected by a 115 kV  
6 transmission line.

7 The Eddy County Substation is connected to the north at Chaves  
8 County Substation by a 230 kV transmission line and connected to the  
9 northeast from Texas by a 345 kV transmission line to SPS's Tolk Plant.  
10 The Eddy County and Potash Junction Substations are fed at 230 kV level  
11 from Cunningham Plant. The Eddy County, Seven Rivers, Pecos, and  
12 Potash Junction Substations are inter-connected by a 230 kV transmission  
13 line which makes up the 230 kV loop in SPS's southeastern New Mexico  
14 service area. The PCA, Potash Junction, Carlsbad, and Pecos Substations  
15 are connected by a 115 kV transmission line.

16 The PCA Substation is fed from the Cunningham Plant at 115 kV  
17 level, while Monument and Taylor Substations are fed at 115 kV level from  
18 the Maddox Plant.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1           The Monument, Oil Center, Whitten, Jal, West Hobbs, and Taylor  
2           Substations are inter-connected by a 115 kV transmission line which make  
3           up the 115 kV transmission loop in SPS's southeast New Mexico service  
4           area. This loop is inter-connected by a 115 kV transmission line to the west  
5           from the Potash Junction, Wipp, and Red Bluff Substations.

6           Please refer to Attachment RCA-1 for a vicinity map of the southeast  
7           New Mexico service area facilities.

1                   **III. DESCRIPTION OF THE PROPOSED PROJECT**

2   **Q.   Please describe the transmission line and associated facilities that are**  
3       **included in the Proposed Project.**

4   **A.   The Proposed Project will involve the construction of a 345 kV transmission**  
5       **line that will be initially operated at 230 kV. This line will connect SPS's**  
6       **existing Potash Junction Substation, located approximately 17 miles**  
7       **northeast of Carlsbad, New Mexico, to the proposed Roadrunner Substation**  
8       **to be located approximately 22 miles northwest of Jal, New Mexico.**

9           At the Potash Junction Substation, the existing 230 kV straight bus  
10       structure will be re-configured to a four breaker ring-bus design expandable  
11       to future breaker and a half design. A new breaker terminal will be added to  
12       connect the proposed 345 kV transmission line to the new Roadrunner  
13       Substation. At the new Roadrunner Substation, the 230 kV bus will be  
14       constructed initially as a single breaker terminal, expandable to future  
15       breaker and a half design, to accommodate the proposed 345 kV  
16       transmission line, and a 230/115 kV 252 MVA autotransformer. The 115 kV  
17       bus arrangement will be initially constructed to four breaker ring with four  
18       115 kV terminals, expandable to breaker and a half design to accommodate  
19       future 115 kV terminals to the retail load customer. Please refer to

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 Attachment RCA-2, which is the electrical one-line diagram of the Proposed  
2 Project.

3 **Q. When does SPS expect the Proposed Project to be placed in service?**

4 A. SPS plans to have the Proposed Project in service on or before October 31,  
5 2015 based on the need for the Proposed Project and the associated  
6 construction schedule timeline. Individual transmission lines and bus  
7 structures may be completed in stages before that date.

8

1                   **IV. POWER SYSTEM STUDIES TO EVALUATE THE NEED**  
2                   **FOR THE PROJECT**

3           **Q.    Please identify and describe the studies that have been performed to**  
4           **evaluate SPS's need for the Proposed Project.**

5           **A.    The Southwest Power Pool ("SPP") conducted several studies that address**  
6           **the need for the proposed transmission line project. The SPP, in its**  
7           **Integrated Transmission Planning study for the Near-Term period, 2014-**  
8           **2019 ("ITPNT"), identifies the need for new transmission facilities in order**  
9           **to improve reliability in the southern New Mexico area. Another study**  
10          **prepared by the SPP, addresses a specific recent request from a new potash**  
11          **mining customer for service on SPS's 115 kV transmission system in its**  
12          **southeast New Mexico service area. Please refer to Attachment RCA-3 for a**  
13          **copy of the SPP Delivery Point Network Study, DPA-2011-June-073. A**  
14          **third study, also prepared by the SPP, is the High Priority Incremental Load**  
15          **Study ("HPILS"), which demonstrates the need for the Proposed Project and**  
16          **recommends that the line be both developed and operated at 345 kV. This**  
17          **study has been completed and is currently being reviewed by stakeholder**  
18          **groups at the SPP.**

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 **Q. Please describe the ITPNT study.**

2 **A.** The ITPNT study focuses on transmission reliability in determining what  
3 transmission upgrades are required in SPP member systems to meet  
4 reliability criteria. The ITPNT examines all member systems of the SPP and  
5 results in members being assigned Notifications to Construct ("NTCs") to  
6 build and own specific projects to improve and maintain network reliability.

7 The ITPNT study is one of three studies that the SPP does on a  
8 cyclical basis. The study covers a forward looking period of 1-6 years and is  
9 done annually. The other two studies are the ITP10, a look at the 10<sup>th</sup>  
10 planning year, and the ITP20, a look at the 20<sup>th</sup> planning year.

11 **Q. What SPS reliability needs were identified by the SPP in the ITPNT**  
12 **study that would be addressed by the Proposed Project?**

13 **A.** The SPP identified the following reliability issues for SPS's transmission  
14 system in southeastern New Mexico: (1) the overload of the Potash Junction  
15 Substation 230/115 kV, 150 MVA transformer for loss of the Pecos  
16 Substation-Potash Junction 230 kV transmission line; and (2) the overload of  
17 the Monument Substation-West Hobbs Switching Station 115 kV  
18 transmission line for loss of the Maddox Plant-Sanger Switching Station 115  
19 kV transmission line. The Proposed Project addresses these overloads. The

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 Proposed Project will also address the low voltage violations at IMC #1  
2 Substation 115 kV bus for the outage of the IMC #1 tap to Intrepid West tap  
3 115 kV transmission line.

4 **Q. Did SPP issue a NTC related to the ITPNT?**

5 A. Yes. A copy of the SPP NTC letter is provided as Attachment RCA-4. The  
6 specific NTC associated with the Proposed Project is Project ID 30569, on  
7 pages 1 and 2 of the letter (Network Upgrade IDs 50708 and 50709).

8 **Q. Please describe the studies that were performed by the SPP and SPS in  
9 relation to the new mining load request.**

10 A. SPS distribution made a request to the SPP for a new delivery point onto  
11 SPS's 115 kV transmission system in the southeastern New Mexico service  
12 area under Attachment AQ of the SPP OATT. Attachment AQ provides the  
13 guidance and study procedures for adding, modifying, or deleting delivery  
14 points for load serving entities. The SPP provided a report in its Delivery  
15 Point Network Study DPA-2011-June-073 (dated 11/11/2011), provided as  
16 Attachment RCA-3, which concluded that there would be significant impacts  
17 due to the addition of the new 80 MW Potash Mine load, and recommends  
18 that SPS construct transmission facilities to mitigate overloads and voltage  
19 violations.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1           SPS's Transmission Planning Department also conducted a study of  
2           the impact of the new mining load in southeastern New Mexico. Attachment  
3           RCA-5 is a copy of the study conducted by SPS in response to the retail  
4           mining load customer's transmission service request to interconnect  
5           approximately 80 MW of new load on SPS's local 115 kV transmission  
6           system. The study determined the impact of the request to interconnect the  
7           new load on the local SPS transmission system at a delivery point near Jal,  
8           New Mexico, and identified the need for several projects in order to mitigate  
9           thermal and voltage violations during system intact and single contingency  
10          events created by the new load. The study tabulated the thermal and voltage  
11          violations (Appendix B), and also tabulated the required upgrades (Table 2),  
12          which includes the following projects:

- 13           • Build a 230/115 kV substation near to the potash mine load center  
14           and run T41 in and out of this new substation. The 115 kV bus  
15           would be of ring bus configuration.
- 16           • Build approximately 45 miles of new 230 kV line using 795 ACSR  
17           conductors from Potash Junction Substation to the new substation,  
18           and 1 mile of 115 kV 795 ACSR line from the new substation to the  
19           customer load center.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

- 1           • Provide a new breaker terminal at Potash Junction Substation and  
2           modify the existing 230 kV straight bus configuration to a ring bus  
3           expandable to a breaker and half configuration.
- 4           • Load side revenue metering needs to be installed at the customer  
5           station.

6           At that time, only one 115 kV feed had been requested by the  
7           customer, although as their in-service date gets closer, multiple 115 kV  
8           service feeds may be necessary due to the size of the load. The studies  
9           performed by SPS and SPP agreed on the recommended configuration of  
10          the Proposed Project, and associated substation facilities.

11   **Q. Please describe SPP's HPILS study.**

12   A. The HPILS addresses the exceptional load growth in various regions of the  
13   SPP. These regions include western Nebraska, southern Kansas, western  
14   and eastern Oklahoma, and southeast New Mexico. The load growth in all  
15   of these areas, except western Nebraska and eastern Oklahoma, is due to oil  
16   and gas drilling and processing.. The southeast New Mexico load growth  
17   was due to the continued high expansion of oil and gas facilities in the  
18   Avalon and Bone Springs shale deposits. The HPILS study examined a 10  
19   year period, and made recommendations for projects to address the load.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 service and network reliability issues over that period. The HPLIS is  
2 currently being finalized by the SPP, and SPS will provide a copy of the  
3 HPILS following publication of the final report by the SPP.

4 **Q. Were NTCs recommended as a result of the HPILS?**

5 **A. Yes.** The HPILS recommends the following NTCs related to the Proposed  
6 Project be issued:

- 7 • Project ID-30637, Upgrade ID- 50871 – Convert 230 kV Potash-  
8 Roadrunner 230 kV line to 345 kV operation;
- 9 • Project ID-30637, Upgrade ID- 50863 - Convert 230 kV Road Runner  
10 substation to 345 kV. Install any necessary 345 kV terminal  
11 equipment; and
- 12 • Project ID-30637, Upgrade ID- 50862 - Install new 345/115 kV 448  
13 MVA transformer at new Road Runner substation. Install any  
14 necessary 115 kV terminal equipment.

15 The proposed in-service dates of the conversion of the Proposed Project to  
16 345 kV operation is 2018.<sup>2</sup>

---

<sup>2</sup> Although not receiving an NTC through the HPILS process, an additional 115 kV transmission line from the Roadrunner 115 kV bus to a new distribution substation called Battle Axe Substation will also be constructed to serve developing energy facility growth.

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1 **Q. Are the proposed recommended NTCs the basis for SPS's decision to**  
2 **build the Proposed Project at 345 kV?**

3 **A. Yes, as previously stated, the proposed transmission line and Roadrunner**  
4 **Substation will be built to 345 kV specifications, but will initially be**  
5 **operated at 230 kV because it is needed to meet the ITPNT NTC and serve**  
6 **the retail load service request. Until additional 345 kV infrastructure is in**  
7 **place, which is expected to be available by 2018, the 230 kV source at**  
8 **Potash Junction is the only viable source available to meet the area reliability**  
9 **requirements and the customer in-service date requirement for the proposed**  
10 **80 MW retail load addition on to the SPS transmission grid.**

11 The Proposed Project is one piece of a larger plan to serve and  
12 expand the existing transmission system that could respond to the current  
13 load inter-connection requests in-service dates and projected load increases  
14 from retail customers in SPS's southeastern New Mexico service area. The  
15 proposed HPILS projects will add 345 kV infrastructure projects in the next  
16 three years to the service area, which include adding 345 kV terminations at  
17 the Potash Junction Substation and the conversion of the Proposed Project to  
18 345 kV systems. Building the transmission line at 345 kV now is more cost

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1           effective than converting from 230 kV to 345 kV later and takes advantage  
2           of economies of scale and scope.

3   **Q.    Has SPS received the recommended NTCs from the HPILS study?**

4   A.    No, not at the time of the filing of my testimony. SPS expects additional  
5           NTCs in early May, and will supplement its filing once the NTCs are issued  
6           by the SPP.

7   **Q.    Other than the operating voltage level, are there any other specification**  
8           **differences between what is described in the ITPNT NTC, the proposed**  
9           **HPILS NTC, the study results from the AQ studies, and the Proposed**  
10          **Project?**

11   A.    No.

12

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1       **V. ESTIMATED COSTS ASSOCIATED WITH PROPOSED PROJECT**

2       **Q.     What is the total estimated cost of the Proposed Project?**

3       **A.     The total estimated cost for the Proposed Project is approximately \$54**  
4       **million. The estimated costs for each component and the Proposed Project**  
5       **are tabulated below.**

<i>Substation</i>	
Roadrunner	\$ 11,552,970.00
Potash Junction	\$ 2,815,807.00
<i>Land</i>	
	\$ 170,000.00
<b>Total Substation Cost</b>	<b>\$ 14,538,777.00</b>
<i>Transmission</i>	
345 kV	\$ 36,025,015.00
115 kV	\$ 1,010,809.00
<b>Total Transmission Cost</b>	<b>\$ 37,035,824.00</b>
<i>Right of Way</i>	\$ 1,350,845.00
<i>AFUDC</i>	\$ 1,083,941.00
<b>Estimated Total Project Cost</b>	<b>\$ 54,009,387.00</b>

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1           The estimated costs include Allowance for Funds Used During  
2           Construction ("AFUDC"). SPS calculated an estimated AFUDC for each  
3           element of the Proposed Project and the total AFUDC is a percent of the  
4           estimated cost. The actual AFUDC will be calculated upon completion of  
5           the Proposed Project.

6   **Q.   Is SPS requesting approval of AFUDC in this proceeding?**

7   A.   Yes. The AFUDC costs are an eligible expense. When the final costs are  
8           reported on the Proposed Project, the AFUDC costs incurred in the  
9           construction of the project will be included in the final project cost.

10 **Q.   Why is the cost estimate in the NTC letter lower than your cost**  
11 **estimate?**

12 A.   The original project cost estimate submitted to SPP last year for the NTC for  
13           both the substation and transmission line projects was for a 230 kV  
14           transmission line design. At the time of the submission, the transmission  
15           line routing details had not yet been established and therefore the overall  
16           transmission line NTC cost estimate used is lower because it was based on  
17           an internal SPS unit dollar cost per mile rate.

18           Subsequently, the project scope was revised from 230 to 345 kV  
19           voltage design as soon as SPS learned from SPP early this year that the

Case No. 14-\_\_\_\_-UT  
Direct Testimony  
of  
Roland C. Azcarraga

1       HPILS would recommend 345 kV terminations at the Potash Junction  
2       Substation including the proposed transmission line 345 kV conversion.  
3       This resulted in a significant increase in the overall project cost due to  
4       material and labor cost increases. Other aspects also affected the overall  
5       project cost estimate such as routing changes that added additional angle,  
6       dead-end, and tangent structures around oil well areas, external construction  
7       labor cost, engineering supervision, project management, and increased  
8       dollar rates used in the SPS estimating software. The HPILS cost estimate,  
9       rather than the last year's estimate, was used for this testimony, thus the  
10      difference. SPS expects SPP to issue a modified NTC letter reflecting the  
11      HPILS cost estimate in the upcoming weeks.

**VI. CONCLUSION**

**Q. Please summarize the conclusion reached in your testimony.**

**A. My testimony establishes the Proposed Project will serve the public convenience and necessity in New Mexico by providing needed transmission capacity to maintain the reliability of SPS's transmission system in the southeastern area of New Mexico. Therefore, I recommend that the Commission: (1) issue a CCN that authorizes the construction and operation of the Proposed Project; and (2) based on my testimony and witness Higgins testimony, grant location approval for the proposed 345 kV transmission line and associated facilities.**

**Q. Were Attachments RCA-1 and RCA-2 prepared by you or under your direct supervision and control?**

**A. Yes.**

**Q. Are Attachments RCA-3 through RCA-5 true and correct copies?**

**A. Yes.**

**Q. Does this conclude your pre-filed testimony?**

**A. Yes.**

**VERIFICATION**

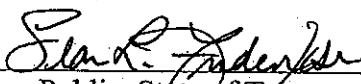

STATE OF TEXAS            )  
                                          ) ss.  
COUNTY OF POTTER        )

Roland C. Azcarraga, first being sworn on his oath, states:

I am the witness identified in the preceding testimony. I have read the testimony and the accompanying attachments and am familiar with their contents. Based upon my personal knowledge, the facts stated in the direct testimony are true. In addition, in my judgment and based upon my professional experience, the opinions and conclusions stated in the testimony are true, valid, and accurate.
